DESCRIPTION

We have expertise in these environmentally friendly methods of waste disposal and conservation of water.

Segregation of solid waste minimizes waste going to landfills, we will set up systems and train staff to manage these types of material.

Our staff will arrange for a feasibility study to install a sewage treatment plant and setup vermicomposting. These systems will enable re-use of water for flushing purposes and gardening thus reducing water consumption. Vermicomposting efficiently disposes of solid organic waste and converts it to compost for use in gardens.

Similarly, we can install a rain-water harvesting system to prevent run-off and replenish the ground water table.

Garden waste and detritus needs to be efficiently disposed off instead of burning it and polluting the atmosphere. We supply shredders and train staff in its use to shred this waste and enable composting.

Installing these systems makes your housing society eco-friendly, reduces costs as well as makes individual members eligible for house tax rebates from the Municipality. Electricity unit rates for common areas too are reduced if such systems are installed and operational.
